

Bolo · August paid-media plan

Budget recommendation for ₹1 crore across 6 campaigns · based on 90 days of data, 1 May – 29 July 2026 · all amounts ex-GST

Recommendation

- Fill josh and glance to the highest spend each has been tested at, and cut inmobi from 48% of the budget to 34.5%. Expected result: 13,479 paying users in August instead of 12,792 (+5%, range +4% to +7%) for the same ₹1 crore, at ₹742 per paying user instead of ₹782.
- Cut **im_cpa_trial** from ₹19.4L to ₹11.7L now, and switch it off as soon as there's somewhere better for the money. It has the second-cheapest trials but the most expensive paying users (₹1,177). It survives at ₹1 crore only because josh and glance are already at their tested ceilings.
- Test whether josh can take more. For two weeks, run **jo_lookalike_5pct** and **jo_interest_learners** 20% above their highest tested spend, funded from **im_cpa_trial**. If their cost per paying user stays under ₹1,075, move the rest of **im_cpa_trial**'s budget too.
- If the budget is cut to ₹60 lakh, switch **im_cpa_trial** off and take **im_cpi_optimised** to its minimum. That keeps 72% of the paying users on 60% of the money.
- Steer every week on cost per paying user, with each day's trials matched to the next day's renewals. Cost per trial rewards campaigns for trials that never pay.

What it's telling you: move money from the two inmobi campaigns to josh and glance until josh and glance reach the highest spend they've been tested at.

August plan at ₹1 crore

campaign	channel	today's split	proposed	expected trials	expected paying users	1st-month net revenue	cost per paying user
jo_retarget_signup	josh	₹5.0L	₹5.7L	4,624	1,965	₹13.4L	₹291
jo_lookalike_5pct	josh	₹16.9L	₹23.3L	11,537	3,759	₹21.0L	₹620
gl_lockscreen_story	glance	₹10.7L	₹13.4L	8,258	1,926	₹7.4L	₹694
jo_interest_learners	josh	₹19.7L	₹23.1L	10,758	2,558	₹10.9L	₹903
im_cpi_optimised	inmobi	₹28.2L	₹22.8L	11,558	2,183	₹9.0L	₹1,046
im_cpa_trial	inmobi	₹19.4L	₹11.7L	10,920	1,086	₹3.7L	₹1,075
total		₹100.0L	₹100.0L	57,654	13,479	₹65.4L	₹742

Headline number: expected paying users (13,479). It's what the budget exists to buy, and it's the unit of the weekly steering metric. Trials fall 3% under this plan while paying users rise 5%, which is exactly the shift the plan is meant to make.

Evidence

1. Campaign performance, trial-day cohorts. Each day's trials are matched to the renewals charged the next day. Flagged data is excluded from these ratios.

campaign	cost per install	cost per trial	trial → paid	cost per paying user	annual plan share	net 1st-month ROAS
jo_retarget_signup	₹16.8	₹115	42.5%	₹270	36%	2.52
jo_lookalike_5pct	₹18.0	₹178	32.6%	₹548	25%	1.02
gl_lockscreen_story	₹8.3	₹147	23.3%	₹630	11%	0.61
jo_interest_learners	₹18.1	₹198	23.8%	₹832	14%	0.51
im_cpi_optimised	₹11.7	₹200	18.9%	₹1,059	13%	0.39
im_cpa_trial	₹23.4	₹117	9.9%	₹1,177	6%	0.29

2. The cheap-trial trap. **jo_retarget_signup** and **im_cpa_trial** have almost the same cost per trial (₹115 and ₹117). But **jo_retarget_signup** has the cheapest paying users (₹270) and **im_cpa_trial** has the most expensive (₹1,177), because only 10% of **im_cpa_trial**'s trials pay. Ranking by net ROAS gives the same order.

3. Diminishing returns are real, so the plan can't just pour money into the best campaign. In 5 of 6 campaigns, high-spend days cost more per paying user than low-spend days. A shared log-log fit across all six campaigns gives an elasticity of 0.74 (standard error 0.07): doubling spend brings about 67% more paying users, not 100%. The plan spends until the next paying user costs the same in every funded campaign, and never goes above or below the daily spend each campaign has actually run at. At ₹1 crore, the last paying user bought costs ₹1,411, nearly twice the plan average.

4. Weekends. josh prospecting gets paying users 5–8% cheaper on weekends; inmobi and josh retargeting are 17–25% more expensive; glance is flat. Worth a four-week scheduling test; not included in the numbers above.

5. Data fixes applied before any of this.

issue	rows	how it was found	handling
Trial tracking outage, jo_interest_learners and jo_lookalike_5pct, 6–12 June	14	13 June renewals exceeded the previous day's trials; trials fell ~95% while installs stayed normal	Kept spend; excluded trial cohorts 5–12 June from ratios; no interpolation
glance revenue reported including 18% GST, 15–21 July	7	Revenue was exactly 1.18× what prices × plans give	Recomputed from trials and renewals (–₹21,677)
im_cpi_optimised spend posted twice, 22 May	1	CPM ₹84 vs a usual ₹42; impressions and installs normal	Halved (–₹74,157); confirm with invoice

Caveats

- Only the first charge is visible. A paying user brings about ₹485 of net revenue in month one, and the marginal user in this plan costs ₹1,411. Whether the last ₹35 lakh is worth spending depends on month-two-onward retention, which this data doesn't contain. That's the first thing to get from the product team.
- Predictions stay inside tested spend levels. The josh ceiling test exists because the data can't say what josh does above its highest tested spend.
- The elasticity is a single shared estimate. Campaign-level fits were too noisy (standard errors 0.13–0.22). The allocation is the same at 0.55 and 0.90; only the size of the gain changes.
- Attribution is taken as given. If inmobi counts installs more generously than josh, part of the gap is measurement, not performance.
- Refunds are booked on the day they happen, so they're applied as each campaign's 90-day refund rate (2.5–2.7% of subscription revenue), not matched to cohorts.
